

Google Applications IE7 settings

Purpose

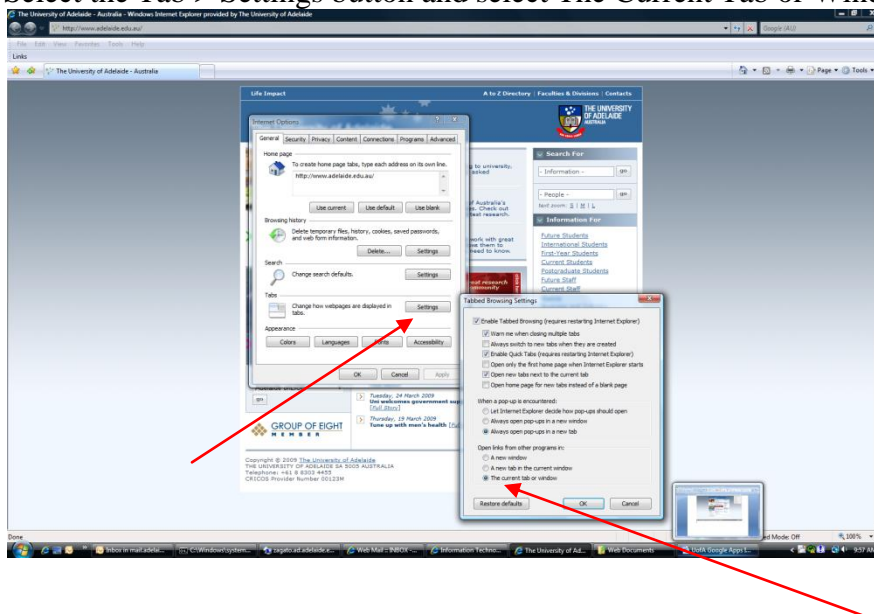

These instructions provide screenshots how to configure Internet Explorer 7 such that there are no blank screens popping up after the login credentials have been entered into the Google Apps login screen. The settings also fix Operation Aborted error messages and Google Calendar being opened in many different windows when the user swaps functions in the interface.

If you login from home, you can use the same settings in your browser.

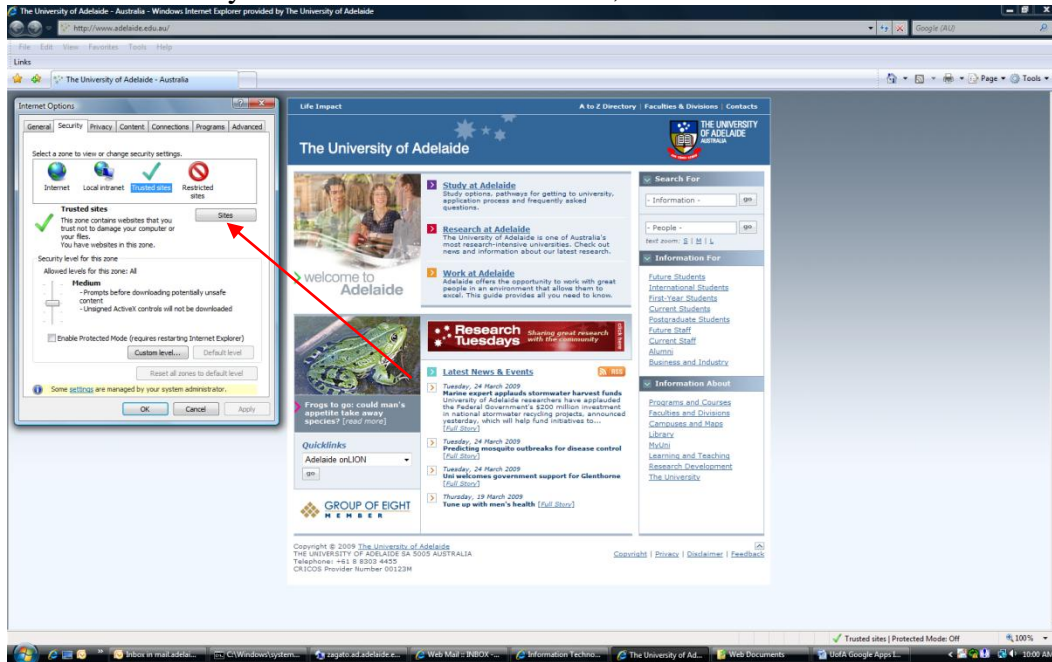

Locate the Tools button on the browser navigation bar and select Internet Options

Select the Tab > Settings button and select The Current Tab or Window radio button, click OK

Select the Security Tab and select Trusted Sites, then the Sites button

Enter *.mail.google.com in the field and click Add , if required, unselect Require server verification (https) for all sites in the zone, then click close. Close the browser and try logging on again, the problem should be fixed.
