

Feeding & Nutrition

Improve milk production through good feeding practice

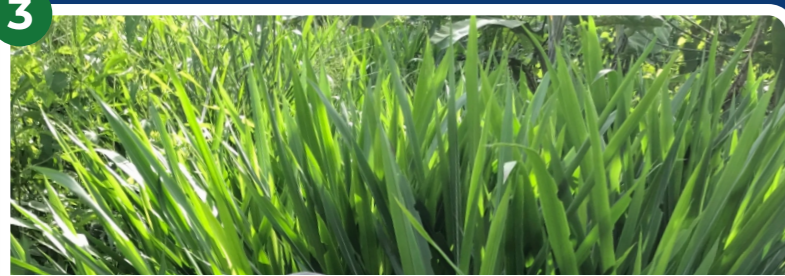

1

Provide clean ad-libitum water to all animals

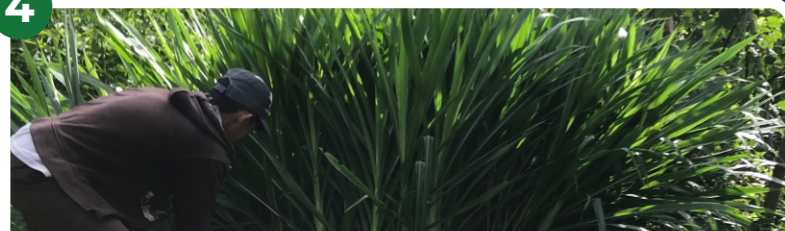

2

Feed CP 16% concentrate for early lactation cows and young heifers

3

Feed quality is important for high dry matter intake (how much the cow can eat)

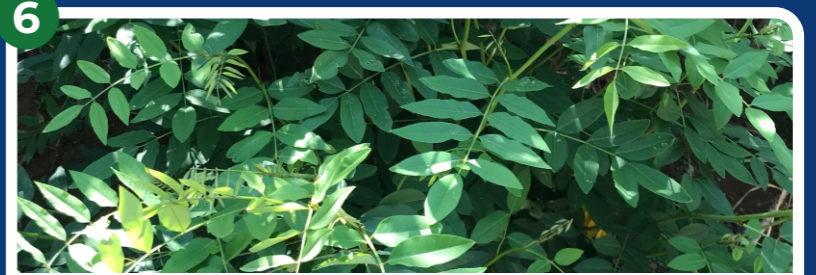

4

Harvest forages for maximum leaf and better quality (eg. Cut at 45-55 days for Elephant Grass)

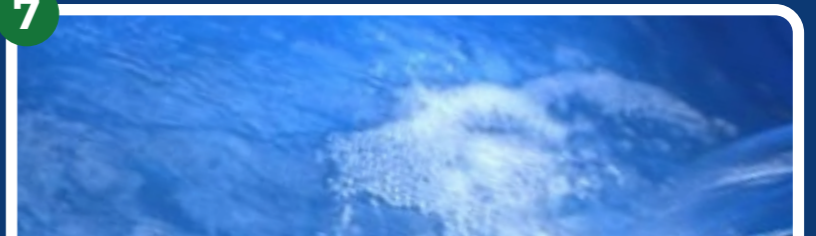

5

Drying forages in the sun and chopping can increase feed intake

6

Legumes can increase protein content in the diet and increase feed intake

7

Good clean water available all the time is important for the dairy herd, particularly cows.

8

Keeping troughs clean helps with intake and cow performance
